Experiment	Purpose	Comparison or calculation	Research question
E0 Main comparison	Compare the four solution spaces	Shared inputs, objectives, constraints, evaluation budget, and ten paired seeds; Pareto fronts and hypervolume	Which combinations of capacity, exposure, and ground release does each method produce?
E1 Permission test	Examine the effect of where permissions are assigned	Randomise building permissions for each operator while retaining unit-level eligible-building counts and approximately matching floor area	Does the allocation of comparable intervention opportunities change the front?
E2 Label statistics	Describe stakeholder categories and intervention targets	Rules mapping uses and attributes to labels; counts and areas by category; unknown-label proportions by unit; label perturbation	How are labels assigned, and which stakeholder categories receive modifications?
E3 Constraint statistics	Identify active controls	Intensity reductions and rejections by method, seed, and constraint	At which stages do height, FAR, and intervention extent restrict candidates?
E4 Exposure scale	Examine the effect of spatial scale on exposure	Recalculate exposure and rankings using 25, 50, and 100 m distances for the same alternatives	How do exposure and rankings change with distance?
E5 Selection tolerance	Examine the stability of grouping and selection	Multiply epsilon by 0.5 and 2, then filter and rank again	How sensitive are preferred solutions to the tolerance?
E6 Matched comparison	Compare equal benefits or equal costs	Narrow net-addition bands, exposure ceilings, and comparison with the merged BL front	How do exposure, capacity, release, and the proportion of solutions not dominated by BL vary under matched conditions?
